Upper gastrointestinal bleeding (UGIB) is a common medical emergency, with a reported mortality of 2-10%. Patients identified as being at very low risk of either needing an intervention or death can be managed as outpatients. For all other patients, intravenous fluids as needed for resuscitation and red cell transfusion at a hemoglobin threshold of 70-80 g/L are recommended.

Management of acute upper gastrointestinal bleeding | The BMJ
Acute upper gastrointestinal bleeding is a medical emergency, and appropriate initial resuscitation is crucial . A normal haemoglobin value and blood pressure at presentation does not rule out substantial bleeding—increased heart rate is a more reliable measure of substantial blood loss. The Glasgow-Blatchford score can help

Gastrointestinal bleeding - Symptoms and causes - Mayo Clinic

Acute lower gastrointestinal (LGI) haemorrhage refers to acute bleeding emanating from the gastrointestinal tract distal to the ligament of Treitz at the junction between the fourth part of the duodenum and the proximal jejunum. The source of the haemorrhage is usually colonic, but it occasionally arises from the small intestine.
