IPCC Report on sources, capture, transport, and storage of CO₂, for researchers, policy-makers and engineers.

For over 70 years, Faber & Kell's has been the definitive reference text in its field. It provides an understanding of the principles of heating and air-conditioning of buildings in a concise manner, illustrating practical information with simple, easy-to-use diagrams, now in full-colour. This new-look 11th edition has been re-organised for ease of use and includes fully updated chapters on sustainability and renewable energy sources, as well as information on the new Building Regulations Parts F and L. As well as extensive updates to regulations and codes, it now includes an introduction that explains the role of the building services engineer in the construction process. Its coverage of design calculations, advice on using the latest technologies, building management systems, operation and maintenance makes this an essential reference for all building services professionals.

Over the past decade, the prospect of climate change resulting from anthropogenic CO₂ has become a matter of growing public concern. Not only is the reduction of CO₂ emissions extremely important, but keeping the cost at a manageable level is a prime priority for companies and the public, alike. The CO₂ capture project (CCP) came together with a common goal in mind: find a technological process to capture CO₂ emissions that is relatively low-cost and able to be expanded to industrial applications. The Carbon Dioxide Capture and Storage Project outlines the research and findings of all the participating companies and associations involved in the CCP. The final results of thousands of hours of research are outlined in the book, showing a successful achievement of the CCP's goals for lower cost CO₂ capture technology and furthering the safe, reliable option of geological storage. The Carbon Dioxide Capture and Storage Project is a valuable reference for any scientists, industrialists, government agencies, and companies interested in a safer, more cost-efficient response to the CO₂ crisis.

Heat transfer enhancement has seen rapid development and widespread use in both conventional and emerging technologies. Improvement of heat transfer fluids requires a balance between experimental and numerical work in nanofluids and new refrigerants. Recognizing the uncertainties in development of new heat transfer fluids, *Advances in New Heat Transfer Fluids: From Numerical to Experimental Techniques* contains both theoretical and practical coverage.

The Montreal Protocol on Substances that Deplete the Ozone Layer was designed so that the phase out schedules could be revised on the basis of periodic scientific and technological assessments. Since the 2002 Assessment of the Technology and Economic Assessment Panel, a large number of technical developments have taken place. The Panel's six Technical Options Committees have each issued a 2006 Assessment Report that document these developments. The present publication contains the report on refrigeration and air conditioning. Publishing Agency: United Nations Environment Programme (UNEP).

Transport choices must be transformed if we are to cope with sustainability and climate change, but this can only be done if we understand how complex transport systems work. Straightforward choices are never made between one transport mode and another; door-to-door movements of both people and freight use combinations of different modes of transport. This book offers a cross-disciplinary overview of transport systems and the ways in which they interact with urban and regional planning decisions and environmental issues. It offers a thoughtful critique of existing methodology and policy, raising issues, providing facts, explaining linkages and, particularly, stimulating debate. The book methodically explores the definitions, trends, problems, objectives and policies of transport planning. In particular the author looks at land use as a major determinant of the nature and extent of the demand for transport, concluding that the management of land use has to be a key element of any sustainable transport policy. *Planning Sustainable Transport* will be essential reading for today's transport specialists, planners and property developers. It will also be useful to postgraduate students in planning and related disciplines.
