The diagnosis and treatment of both congenital and acquired thoracic pathologies in children and adolescents require a high degree of specialization. This book provides practical guidelines for thoracic surgeons who operate on patients from neonatal age to adolescence and for pediatric surgeons who are challenged to treat disorders such as cystic malformations of the lung, mediastinal tumors, or chest wall deformities. The chapters, written by internationally acclaimed authors, include expert commentaries with tips and tricks for the clinical practice. Plus: QR codes for access to videos of surgical procedures (If you have problems to play the videos on your apple device please download the file "download all videos" below).

Following on from the success of the international best-seller "Key Questions in Cardiac Surgery", the long-awaited "Key Questions in Thoracic Surgery" will be the next book in the Key Questions series to be released. This book will systematically cover all the main topics involved in the current practice of a thoracic surgeon. It will incorporate current guidelines for practice (such as from the American College of Chest Physicians, British Thoracic Society and European Respiratory Society) and up-to-date information based on current literature. Each chapter will be structured to include aetiology, pathophysiology, clinical features, indications for surgery, perioperative management, surgical options and postoperative care. Possible complications will be discussed and the results of current practice presented. Importantly, there will be a section on basic sciences related to the practising thoracic surgeon and a further section on thoracic investigations with many images illustrating the variety of pathologies. Each chapter will also contain important references for further reading and greater depth of knowledge. The data and body of knowledge presented in this book is strictly evidence-based and is relevant to all thoracic surgical trainees, at any stage of their training programme. It will provide residents, fellows and specialist registrars the necessary information to carry out their daily duties. Respiratory physicians and thoracic intensive care unit specialists will also find the book useful in terms of the indications and surgical management of these patients, as they are integral to the thoracic surgical process. Another important group is the nursing staff, physiotherapists and other professions allied to medicine working with patients with adult thoracic disease either pre-operatively or post-operatively, as it will help to give a detailed understanding of the principles surrounding thoracic surgical disease. Most importantly, the book is ideal as a revision aid for residents/registrar undertaking their Cardiothoracic Surgery Board examinations around the world. Although these examinations vary in format in different countries, this book is applicable to all cardiothoracic surgical trainees. Its concise, yet complete coverage of the important topics, make it the ideal guide to answer the key questions in thoracic surgery that are asked within the confines of an examination.
